Mini Project Title: Noodle Cook Menu Management System

Programme : Bachelor of Computer Science (*Data Engineering*)

Subject Code : SECJ2154

Subject Name : Object Oriented Programming (OOP)

Session-Sem : 2024/2025-2

Prepared by	:	1. CHERYL CHEONG KAH VOON 2. AIN NURNABILA BINTI MOHD AZHAR 3. NG YU HIN	(A23CS0060) (A23CS0207) (A23CS0148)
Section	:	02	
Lecturer	:	Dr ZURAINI BINTI ALI SHAH	
Date	:	16-6-2025	

Introduction

In today's fast-paced food service field, efficiency and real-time communication are crucial for delivering high-quality service. However, a lot of tiny restaurants and food trucks continue to use manual procedures including handwritten menus, spoken orders, and paper sales

records. These outdated procedures may result in low client satisfaction, delayed preparation, and misunderstandings.

The Noodle Cook Menu Management System was created to make operating a restaurant that serves noodles easier. In order to manage noodle dish menus, update food availability, track preparation statuses, and provide real-time sales data, this system focuses on offering an interactive and user-friendly interface. This Java-based application uses organized design and automation to increase overall kitchen productivity, decrease human error, and improve operational accuracy using the concepts of Object-Oriented Programming (OOP).

Problem statement

Some restaurants still rely on manual menu boards, handwritten notes or verbal communication between kitchen and service area. This will result in:

- Miscommunication on dish availability or preparation
- Difficulty tracking which dishes are sold out or in progress.
- Orders being missed or forgotten due to the lack of a centralized order tracking system
- Lack of real-time visibility for kitchen staff
- No automated daily/weekly sales summaries

To address these issues, we propose a system with the following functionalities:

- Menu management (add, update, remove noodle dishes)
- Real-time dish status updates (e.g., available, sold out, in preparation)
- User authentication for admin access
- Food preparation tracking
- Kitchen display panel for current orders and their status
- Daily/weekly sales reports generation

Class Diagram of the project

Techniques/Software/Tools Being Used

To successfully develop the Noodle Cook Menu Management System, the following techniques, software, and tools are applied:

Development Environment:

Visual Studio Code (VS Code) – used as the main integrated development environment (IDE) for writing, testing, and debugging Java code, along with extensions like Java Extension Pack.

UML Diagramming Tool:

draw.io – applied to design the class diagram, allowing clearer vision of the system's object relationships and overall architecture.

Documentation Tools:

Microsoft Word – used for writing the project proposal, technical documentation, and final report.

Technique Used:

Association, Inheritance, Composition, Enum, Abstract Class, Exception Handling, Polymorphism
