

SEMESTER 2/20252026

SECP3106- APPLICATION DEVELOPMENT (WBL)

LAB ASSIGNMENT 1

SECTION 02

LECTURER: DR. SEAH CHOON SEN

Name	NO. MATRIC
CHERYL CHEONG KAH VOON	A23CS0060

1.0 Title of the assignment

Lab Assignment 1: Daily Activities Recorder App

2.0 Objective

The objective of this lab assignment is

- To apply basic concepts of Flutter development learned in Lessons 1, 2, and 3
- To practice structuring a Flutter project and implementing widget layouts
- To implement state management using the `setState()` method
- To gain hands-on experience with `TextField` for user input and `ListView` for data display

3.0 Brief description of the system

The Daily Activities Recorder App is a simple Flutter-based application designed to help users log their daily tasks.

- **Data Input:** Users can enter the name of an activity and its corresponding time or category.
- **State Management:** The app uses a `StatefulWidget` to handle the addition and removal of data without the need for an external database.
- **Functionality:** When the user adds an activity, the interface updates immediately to show the new entry in a list. Users also have the option to remove completed or unwanted tasks.

4.0 Explanation of the interface

The interface is designed for clarity and ease of use, following the suggested mockup:

- **Activity Name TextField:** This input field allows the user to type the name of the daily task (e.g., "Study Flutter").
- **Time/Category TextField:** This field is used to record when the activity occurs or what category it belongs to (e.g., "8:00 PM" or "Exercise").
- **Add Activity Button:** Once clicked, this button triggers the `addActivity` logic, saving the input to the list and refreshing the UI via `setState()`.
- **Activity List (ListView):** This area dynamically displays all recorded activities in a scrollable format.
- **Delete Button:** Each activity entry features a delete button to remove that specific item from the list.

5.0 Screenshots of the app

6.0 Conclusion

In conclusion, I have successfully developed a Daily Activities Recorder App that has met all the requirements. This project demonstrated the effective use of `StatefulWidget` and `setState()` to create a responsive user interface. I have also learned how to manage user inputs and display dynamic data lists, which are fundamental skills for mobile app development.
