INDUSTRY TALK

PROJECT MANAGEMENT

HISTORY

The speaker graduated from UTM in 2015 and began his career at the INTEL Corporation Penang. At that time, they were engaged in testing the i9 processor, while their company was adhering to the waterfall methodology for project execution. This marked the first occasion he engaged in comprehensive project management responsibilities since his university days.

COMMUNICATION is one of the most crucial part the speaker keep emphasizing when working on a project. It is important to get the exact requirement the client request to prevent the project designed do not meet the client's expectation. Besides, team communication plays a significant role to ensure smooth flow of a project management.

Opening a burger stall using agile...

The speaker uses the example of running a burger stall to explain the agile methodology. Agile is a way when you create a product and you will get feedbacks from your users and keep improving your product until a perfect product is produced.

1st iteration

burger is too plain!

Start making the most 'basic' burger with only one slice of patty in between the buns. Then, getting the feedback to make a better burger. Adding more ingredients, lettuce and sauces.

2nd iteration

not bad

Willing to do the best so you add a lot more ingredients to make a more standardized and yummy burger.

3rd iteration

patty is not that juicy...

Repeat in changing and implementing to make the best tasted burger.

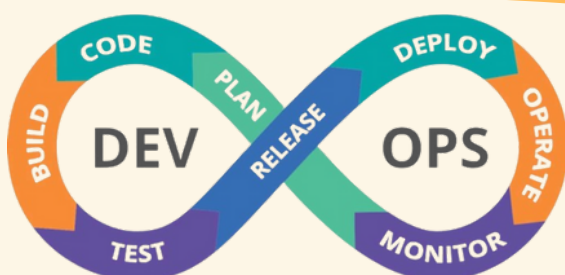

The main concept is that the current output will be tomorrow's input. From the feedbacks, we improve constantly to finally come out with a desired product.

AGILE

- An iterative approach to software development that emphasizes flexibility, collaboration, and customer feedback.
- Breaks the project into smaller iterations or sprints, typically lasting from one to four weeks.

AZURE DEVOPS

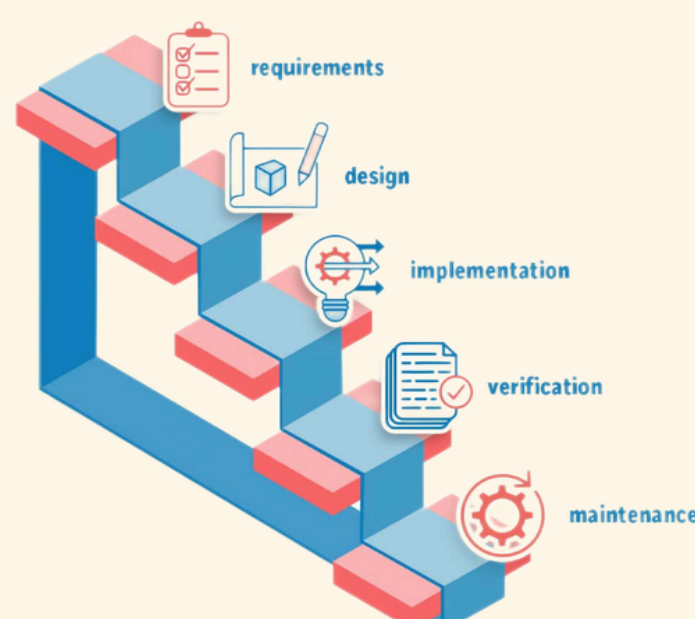

AZURE DEVOPS and **AGILE** are related but distinct concepts in the project management world. Azure DevOps is a set of tools and services provided by Microsoft that support the implementation of Agile principles and practices, as well as other software development methodologies. Azure DevOps covers the entire software development lifecycle, from planning and coding to testing, releasing, deployment, operating, and monitoring making it a comprehensive solution for teams following Agile or other development methodologies.

SCRUM is a popular framework used commonly in agile software development. It's broken down into few small goals to be completed in a given timeframe, called sprints. Scrum encourages teams to learn through experience while reflecting on their past successes and mistakes to continuously improve.

SCRUM

WATERFALL

WATERFALL management is a traditional project management methodology. It follows a linear process that broken down into phases that flow naturally into one another: analysis, design, implementation, testing and maintenance. However, agile hybrid method which combined the structured of traditional waterfall. This hybrid method emphasizes iterative cycles within looping through cycles of design, implementation, testing and maintenance seamlessly.

REFLECTION

NEO LI XIN

During the start of the talk given by the esteemed Mr. Abdul, I admire how he relate with the burger ordering system to educate us about the agile methodology, it was simpler to understand that way. Besides, he introduced various project management methodologies and each purposes. He also explained the practical implementation of project management workflows within a company setting, for example how they communicate with each other through website such as GitHub. Through this talk, I'm inspired to practice these project management methodologies in my future projects and assignments so that I can hopefully improve the overall team performance and efficiency.

CHERYL CHEONG KAH VOON

I benefited a lot from this speech. First, I learned some project management methodologies for development such as Waterfall, and Agile and how they work in our projects. Waterfall follows the sequential while agile is always in a looping. We all know that communication in a team is very important so the speaker introduced me to the mediums used for communication during the development phase, such as Slack and Microsoft Teams. I also gained much knowledge from this lecture. The speaker also showed us how to use GitHub for project management and its benefits. I learned a lot and will continue learning more skills in this area. I believe this will be of great help to my future career.

LAU YEE WEN

The industrial talk on project development methodologies provided useful information about agile development, scrum, and the waterfall method. Before the talk, I thought project development was an inflexible process, but now I find out agile as a flexible and collaborative approach. Agile's emphasis on adaptability and customer feedback resonated with me, and I intend to use these principles in future projects. The talk emphasized that the agile approach requires continuous changes to meet customer expectations, which aligns with its iterative nature. While I anticipate challenges in implementing agile methodologies such as scrum, I believe the benefits of improved project outcomes and stakeholder satisfaction make the effort worthwhile.

CHAU YING JIA

During this industrial talk, I learned about project management in a clear and practical way. The speaker discussed different methods like waterfall, agile, and scrum. They also showed how these methods are applied in real business situations. I discovered that the waterfall method is becoming less popular because it doesn't always lead to the best results. Instead, agile is preferred because it allows for continuous improvement until a perfect product is achieved. The speaker emphasized the importance of communication, especially when working with colleagues. This session inspired me to use agile project management techniques in the future to enhance team productivity and performance.

WOO CHENG SHUAN

This industrial talk given by Mr. Abdul Alim gave insightful information about different project management techniques and resources. In order to help us understand the approaches better and make them easier for us to apply in the future to our careers, he demonstrated how to use them with some instances. Furthermore, he utilises management techniques to draw attention to the significance of organisation and communication in the role of a Data Engineer. I will make an effort to keep these approaches in mind and apply them to enhance productivity and project success.
